

To study the size of Uranium nucleus, we bombard the  ${}_{92}^{238}\text{U}$  by  $\alpha$ -particle, namely  ${}^4_2\text{He}$  nucleus. How much energy of  $\alpha$ -particle is required such that it can just reach the surface of the big Uranium nucleus without smashing the system?

$$R({}^{238}\text{U}) = R_0 (238)^{\frac{1}{3}} = 1.07 \text{ fm} \cdot 238^{\frac{1}{3}} = 6.63 \text{ fm}$$

$$\text{K.E. (initial } \alpha) + \text{Zero P.E. (initial)} = \text{Zero K.E. (turning point)} + \text{P.E. (shortest pt.)}$$

$$\text{K.E.} + 0 = 0 + \frac{kz \cdot 2e^2}{R}$$

$$\text{K.E.} = \frac{9 \times 10^9 \times 92 \times 2 (1.6 \times 10^{-19})^2}{6.63 \times 10^{-15}} \text{ eV} = 4 \times 10^7 \text{ eV} = 40 \text{ MeV}$$

What is the threshold energy of  $\alpha$ -particle?

${}^4_2\text{He}$	4.00260 u	${}^{17}_8\text{O} = 16.99913 \text{ u}$
${}^{14}_7\text{N}$	14.00307 u	${}^1_1\text{H} = 1.00783 \text{ u}$
<hr/>	18.00567 u	<hr/>
		18.00696 u
	└── discrepancy ──┘	

$$0.00129 \text{ u} = 1.20 \text{ MeV}/c^2$$

$\alpha$  particle must have at least 1.2 MeV to initiate the process.
